

1. Introduction & Core Architecture

Moseva is a state-of-the-art, high-fidelity **Full-Stack Service Gig Marketplace** engineered for local and remote service exchanges. The platform enables secure, dynamic interactions between **Patrons** (clients posting tasks) and **Service Partners** (specialized professionals fulfilling gigs) under the direct supervision of **Stewards** (moderation backoffice staff).

Key Technological Assets:

System Feature	Implementation Details	Operational Impact
Silent JWT Refresh	Interceptors catch 401s, request /auth/refresh asynchronously	Zero user disruption during session expiry
Real-time Messaging	Authenticated duplex Socket.IO channels with badge counts	Instant live negotiations linked to active gigs
Database Auto-Sync	Sequelize ORM auto-scanning and synchronizing in real time	Zero-downtime structural schema alterations
Regulatory DPDP Cell	India DPDP Act personal data erasure audit trails	Guaranteed compliance, privacy rights, and security
Google Auth Gateway	Dynamic profile syncing via Google Client tokens	One-click frictionless authentication and onboarding

2. User Operations Guide (Patrons & Partners)

Moseva offers unified dashboard interfaces tailored beautifully to each user's primary marketplace role while guaranteeing access to security and grievance centers.

2.1 Onboarding and Google Login

Users can onboard using the standard credentials form or via the integrated **Google Sign-In button**. When registering with Google, the platform automatically captures and syncs the user's verified name, email, and Google profile picture, while preserving their chosen platform role (Patron or Service Partner).

2.2 The Patron Lifecycle (Client)

- Posting a Job:** Click + *Post a New Job*. Define the gig title, category, budget limit, location specifications (flexible or physical address), priority (low, medium, high, urgent), and deadline.
- Reviewing Proposals:** As soon as Service Partners submit bids, they propagate in real time under *Proposals & Gigs*.
- Appointing Partners:** Clicking *Accept & Appoint* locks in the selected partner, updates the gig status to 'in_progress', and automatically cancels other pending bids.
- Completion:** Once the service is successfully rendered, click *Mark Gig as Completed* to close the agreement.

2.3 The Service Partner Lifecycle (Tasker)

1. **Exploring Gigs:** Browse active approved gigs inside the global *Explore Marketplace*. Filter by status, search queries, or price caps.
2. **Submitting Bids:** Select a job and submit a specialized bid proposal detailing your price request and expected completion duration.
3. **Real-time Chatting:** Once appointed, chat directly with the Patron via the *Messages* panel to coordinate timelines.

■■ User Grievance & DPDP Act Data Removal Portal

Every user has immediate access to the **Support & Grievances** tab in their dashboard. Here they can:

- **Submit Grievances:** Report system bugs, workflow errors, or submit platform feedback to Stewards.
- **Request Personal Data Erasure (DPDP Act Compliance):** File a formal erasure claim under the Indian DPDP Act. This transparently logs a data erasure request and places the profile in queue for audit and complete deactivation by the Steward cell.

3. Steward Backoffice & Superadmin Guide

The platform is regulated by the Steward Cell, which monitors system metrics, moderates listings, manages roles, and processes data protection audits.

3.1 Superadmin Access Credentials

The platform features a priority root account with verified, unrestricted bypass access. Steward staff can gain superadmin access with the following seeded parameters:

Parameter	Configured Value	System Impact
Target Email	superadmin@moseva.com	Identifies root user account
Access Username	superadmin	Default platform handle
Seeded Password	Refer to system config / seeder	High-entropy priority passphrase
Assigned Role	superadmin	Unrestricted application access bypass

3.2 Backoffice Control Tabs

The newly integrated, highly premium **Admin Operations Cell** features five professional oversight sections:

- **System Overview:** Renders instant dashboard counters reporting total users, active users, posted jobs, and unresolved issues, combined with logs of recent user signups and latest job postings.
- **User Registry:** Audit all users, instantly change user roles (Patron, Service Partner, Steward, Admin) via dropdown selectors, or deactivate/activate accounts. (Note: The Superadmin role is strictly protected and cannot be deactivated or altered by other admins).
- **Gig Moderation:** Review pending posted gigs. Steward staff can instantly approve gigs to make them public, reject them (requiring a custom rejection reason displayed to the user), or cancel active posts.
- **Customer Complaints:** Audit, track, and update the status of platform feedback/bugs (Open, In Progress, Resolved, Dismissed) while logging public staff audit notes.

■■ India DPDP Act Compliance & Deactivation Audits

When a user files a personal data erasure request, it lists immediately in the **DPDP Grievances Registry**. To comply with legal privacy mandates, the Steward staff can inspect the request and click **Erase & Deactivate User**. This action automatically deactivates the user's login access, flags their profile as inactive, registers a compliance audit log, and stamps the precise erasure completion time in the system database.

4. Technical Commands & Operation Scripts

For platform administrators or developers, Moseva is easily managed via key automated terminal scripts.

4.1 Seeding the Superadmin

To quickly seed or restore the Superadmin root credentials in the PostgreSQL database, execute the following script from the backend directory:

```
cd backend
node src/scripts/seed-superadmin.js
```

4.2 Launching the Platform Dev Servers

To run the marketplace platform in local development, boot both the backend API server and Vite frontend compiler:

```
# 1. Start Backend Server (on Port 5001)
cd backend && npm run dev

# 2. Start Frontend Vite Server (on Port 5173)
cd frontend && npm run dev
```

4.3 Seeding Demo Marketplace Data

To populate a blank database immediately with realistic mock profiles, jobs, bids, and reviews for testing purposes, execute:

```
cd backend
node seed-demo-data.js
```
